

# FLUE GAS

## Dedusting of boiler installations

Efficient dedusting of flue gases is necessary following combustion processes that use scrap wood, dust or other materials to generate energy. SCHEUCH has at its disposal a number of different and proven technologies for this sector. Depending on the required clean gas dust values and the composition of the flue gas, the most economical solution can be chosen for each application: multi-cyclones (primarily for pre-separation), dry electrostatic precipitator or IMPULSE bag filter systems for the lowest clean gas values.
