

WOOD BASED PANEL INDUSTRY

A complete program of products and services

Our proven air extraction, de-dusting and transport systems - and above all new technologies for cleaning dryer exhaust gases or press exhaust gas cleaning - have made us a competent and reliable partner. Like no other company, Scheuch offers a complete program of products and services for all production sectors in the chipboard, fibreboard and OSB industries. The program includes fans, cyclones, bag filters, dry and wet electrostatic precipitator (including process water treatment), exhaust gas scrubbers, fibre screening equipment and discharge equipment (screw conveyors). Pipe components, shut-off and flow control valves, dust collectors and a structural steel engineering division round out the company's program for turnkey installations.

Our program of supporting services includes consulting, planning and plant design, engineering (including both basic and detail engineering), a complete service program with measurement programs for noise and exhaust pollutants, and a special customer support model for the plant startup phase. To further help customers budget their resources and reduce risks when starting production, we also assume overall responsibility for employee training, maintenance, a spare parts management program, a variety of optimization phases and remote monitoring.
